

# STM8L151x8 STM8L152x8 STM8L151R6 STM8L152R6

8-bit ultralow power MCU, up to 64 KB Flash + 2 KB data EEPROM,  
RTC, LCD, timers, USARTs, I2C, SPIs, ADC, DAC, comparators

## Features

- Operating conditions
  - Operating power supply: 1.65 to 3.6 V (without BOR), 1.8 to 3.6 V (with BOR)
  - Temp. range: –40 to 85, 105 or 125 °C
- Low power features
  - 5 low power modes: Wait, Low power run (5.9 µA), Low power wait (3 µA), Active-halt with full RTC (1.4 µA), Halt (400 nA)
  - Dynamic power consumption: 200 µA/MHz+330 µA
  - Fast wake up from Halt mode (4.7 µs)
  - Ultra low leakage per I/O: 50 nA
- Advanced STM8 core
  - Harvard architecture and 3-stage pipeline
  - Max freq: 16 MHz, 16 CISC MIPS peak
  - Up to 40 external interrupt sources
- Reset and supply management
  - Low power, ultrasafe BOR reset with 5 programmable thresholds
  - Ultralow power POR/PDR
  - Programmable voltage detector (PVD)
- Clock management
  - 32 kHz and 1-16 MHz crystal oscillators
  - Internal 16 MHz factory-trimmed RC and 38 kHz low consumption RC
  - Clock security system
- Low power RTC
  - BCD calendar with alarm interrupt,
  - Digital calibration with +/- 0.5ppm accuracy
  - Advanced anti-tamper detection
- DMA
  - 4 ch. for ADC, DACs, SPIs, I<sup>2</sup>C, USARTs, Timers, 1 ch. for memory-to-memory
- LCD: 8x40 or 4x44 w/ step-up converter
- 12-bit ADC up to 1 Msps/28 channels
  - Temp. sensor and internal ref. voltage

- Memories
  - Up to 64 KB of Flash memory with up to 2 KB of data EEPROM with ECC and RWW
  - Flexible write/read protection modes
  - Up to 4 KB of RAM
- 2x12-bit DAC (dual mode) with output buffer
- 2 ultralow power comparators
  - 1 with fixed threshold and 1 rail to rail
  - Wakeup capability
- Timers
  - Three 16-bit timers with 2 channels (IC, OC, PWM), quadrature encoder
  - One 16-bit advanced control timer with 3 channels, supporting motor control
  - One 8-bit timer with 7-bit prescaler
  - 1 Window and 1 independent watchdog
  - Beeper timer with 1, 2 or 4 kHz frequencies
- Communication interfaces
  - Two synchronous serial interface (SPI)
  - Fast I<sup>2</sup>C 400 kHz SMBus and PMBus
  - Three USARTs (ISO 7816 interface + IrDA)
- Up to 67 I/Os, all mappable on interrupt vectors
- Up to 16 capacitive sensing channels with free firmware
- Fast on-chip programming and non-intrusive debugging with SWIM, Bootloader using USART
- 96-bit unique ID

# 1 Introduction

This document describes the features, pinout, mechanical data and ordering information for:

- **High density STM8L15xxx devices:** STM8L151x8 and STM8L152x8 microcontrollers with a Flash memory density of 64 Kbytes.
- **Medium+ density STM8L15xxx devices:** STM8L151R6 and STM8L152R6 microcontrollers with Flash memory density of 32 Kbytes.

For further details on the STMicroelectronics Ultralow power family please refer to [Section 2.3: Ultralow power continuum on page 12](#).

For detailed information on device operation and registers, refer to the reference manual (RM0031).

For information on to the Flash program memory and data EEPROM, refer to the programming manual (PM0054).

For information on the debug module and SWIM (single wire interface module), refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).

For information on the STM8 core, refer to the STM8 CPU programming manual (PM0044).

# 2 Description

The high density and medium+ density STM8L15xx Ultralow power devices feature an enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low power operations.

The family includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive in-application debugging and ultrafast Flash programming.

All high density and medium+ density STM8L15xx microcontrollers feature embedded data EEPROM and low power low-voltage single-supply program Flash memory.

The devices incorporate an extensive range of enhanced I/Os and peripherals, a 12-bit ADC, two DACs, two comparators, a real-time clock, four 16-bit timers, one 8-bit timer, as well as standard communication interfaces such as two SPIs, an I<sup>2</sup>C interface, and three USARTs. A 8x40 or 4x44-segment LCD is available on the STM8L152x8 devices. The modular design of the peripheral set allows the same peripherals to be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, and simplified even more by the use of a common set of development tools.

## 2.1 STM8L Ultralow power 8-bit family benefits

High density and medium+ density STM8L15xx devices are part of the STM8L Ultralow power family providing the following benefits:

- Integrated system
  - Up to 64 Kbytes of high-density embedded Flash program memory
  - Up to 2 Kbytes of data EEPROM
  - Up to 4 Kbytes of RAM
  - Internal high-speed and low-power low speed RC.
  - Embedded reset
- Ultralow power consumption
  - 1  $\mu$ A in Active-halt mode
  - Clock gated system and optimized power management
  - Capability to execute from RAM for Low power wait mode and Low power run mode
- Advanced features
  - Up to 16 MIPS at 16 MHz CPU clock frequency
  - Direct memory access (DMA) for memory-to-memory or peripheral-to-memory access.
- Short development cycles
  - Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals.
  - Wide choice of development tools

STM8L Ultralow power microcontrollers can operate either from 1.8 to 3.6 V (down to 1.65 V at power-down) or from 1.65 to 3.6 V. They are available in the  $-40$  to  $+85$  °C and  $-40$  to  $+125$  °C temperature ranges.

These features make the STM8L Ultralow power microcontroller families suitable for a wide range of applications:

- Medical and handheld equipment
- Application control and user interface
- PC peripherals, gaming, GPS and sport equipment
- Alarm systems, wired and wireless sensors
- Metering

The devices are offered in four different packages from 48 to 80 pins. Different sets of peripherals are included depending on the device. Refer to [Section 3](#) for an overview of the complete range of peripherals proposed in this family.

All STM8L Ultralow power products are based on the same architecture with the same memory mapping and a coherent pinout.

[Figure 1](#) shows the block diagram of the High density and medium+ density STM8L15xx families.

## 2.2 Device overview

**Table 2. High density and medium+ density STM8L15xx low power device features and peripheral counts**

Features		STM8L15xC8	STM8L15xR8	STM8L15xM8	STM8L15xR6
Flash (Kbytes)		64	64	64	32
Data EEPROM (Kbytes)		2			1
RAM (Kbytes)		4	4	4	2
LCD		8x28 or 4x32 <sup>(1)</sup>	8x36 or 4x40 <sup>(1)</sup>	8x40 or 4x44 <sup>(1)</sup>	8x36 or 4x40 <sup>(1)</sup>
Timers	Basic	1 (8-bit)	1 (8-bit)	1 (8-bit)	1 (8-bit)
	General purpose	3 (16-bit)	3 (16-bit)	3 (16-bit)	3 (16-bit)
	Advanced control	1 (16-bit)	1 (16-bit)	1 (16-bit)	1 (16-bit)
Communication interfaces	SPI	2	2	2	2
	I2C	1	1	1	1
	USART	3	3	3	3
GPIOs		41 <sup>(2)</sup>	54 <sup>(2)</sup>	68 <sup>(2)</sup>	54 <sup>(2)</sup>
12-bit synchronized ADC (number of channels)		1 (25)	1 (28)	1 (28)	1 (28)
12-Bit DAC Number of channels		2 2	2 2	2 2	2 2
Comparators (COMP1/COMP2)		2	2	2	2
Others		RTC, window watchdog, independent watchdog, 16-MHz and 38-kHz internal RC, 1- to 16-MHz and 32-kHz external oscillator			
CPU frequency		16 MHz			
Operating voltage		1.8 to 3.6 V (down to 1.65 V at power-down) with BOR 1.65 to 3.6 V without BOR			
Operating temperature		– 40 to +85 °C / – 40 to +105 °C / – 40 to +125 °C			
Packages		UFQFPN48 LQFP48	LQFP64	LQFP80	LQFP64

1. STM8L152xx versions only.

2. The number of GPIOs given in this table includes the NRST/PA1 pin but the application can use the NRST/PA1 pin as general purpose output only (PA1).

## 2.3 Ultralow power continuum

The Ultralow power STM8L151xx and STM8L152xx are fully pin-to-pin, software and feature compatible. Besides the full compatibility within the family, the devices are part of STMicroelectronics microcontrollers UltraLow power strategy which also includes STM8L101xx and STM32L15xxx. The STM8L and STM32L families allow a continuum of performance, peripherals, system architecture, and features.

They are all based on STMicroelectronics 0.13  $\mu\text{m}$  Ultralow leakage process.

- Note:
- 1 The STM8L151xx and STM8L152xx are pin-to-pin compatible with STM8L101xx devices.
  - 2 The STM32L family is pin-to-pin compatible with the general purpose STM32F family. Please refer to STM32L15xx documentation for more information on these devices.

### Performance

All families incorporate highly energy-efficient cores with both Harvard architecture and pipelined execution: advanced STM8 core for STM8L families and ARM Cortex™-M3 core for STM32L family. In addition specific care for the design architecture has been taken to optimize the mA/DMIPS and mA/MHz ratios.

This allows the Ultralow power performance to range from 5 up to 33.3 DMIPs.

### Shared peripherals

STM8L151xx/152xx and STM32L15xx share identical peripherals which ensure a very easy migration from one family to another:

- Analog peripherals: ADC1, DAC1/DAC2, and comparators COMP1/COMP2
- Digital peripherals: RTC and some communication interfaces

### Common system strategy

To offer flexibility and optimize performance, the STM8L15xx and STM32L15xx devices use a common architecture:

- Same power supply range from 1.65 to 3.6 V. For STM8L101xx and medium density STM8L15xx, the power supply must be above 1.8 V at power-on, and go below 1.65 V at power-down.
- Architecture optimized to reach ultralow consumption both in low power modes and Run mode
- Fast startup strategy from low power modes
- Flexible system clock
- Ultrasafe reset: same reset strategy for both STM8L15xx and STM32L15xx including power-on reset, power-down reset, brownout reset and programmable voltage detector.

### Features

ST UltraLow power continuum also lies in feature compatibility:

- More than 10 packages with pin count from 20 to 100 pins and size down to 3 x 3 mm
- Memory density ranging from 4 to 128 Kbytes

LCD: Liquid crystal display  
POR/PDR: Power on reset / power-down reset  
RTC: Real-time clock  
SPI: Serial peripheral interface  
SWIM: Single wire interface module  
USART: Universal synchronous asynchronous receiver transmitter  
WWDG: Window watchdog

### 3.1 Low power modes

The High density and medium+ density STM8L15xx devices support five low power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Wait mode:** CPU clock is stopped, but selected peripherals keep running. An internal or external interrupt or a Reset can be used to exit the microcontroller from Wait mode (WFE or WFI mode).
- **Low power run mode:** The CPU and the selected peripherals are running. Execution is done from RAM with a low speed oscillator (LSI or LSE). Flash memory and data EEPROM are stopped and the voltage regulator is configured in Ultralow power mode. The microcontroller enters Low power run mode by software and can exit from this mode by software or by a reset. All interrupts must be masked. They cannot be used to exit the microcontroller from this mode.
- **Low power wait mode:** This mode is entered when executing a Wait for event in Low power run mode. It is similar to Low power run mode except that the CPU clock is stopped. The wakeup from this mode is triggered by a Reset or by an internal or external event (peripheral event generated by the timers, serial interfaces, DMA controller (DMA1), comparators and I/O ports). When the wakeup is triggered by an event, the system goes back to Low power run mode. All interrupts must be masked. They cannot be used to exit the microcontroller from this mode.
- **Active-halt mode:** CPU and peripheral clocks are stopped, except RTC. The wakeup can be triggered by RTC interrupts, external interrupts or reset.
- **Halt mode:** CPU and peripheral clocks are stopped, the device remains powered on. The wakeup is triggered by an external interrupt or reset. A few peripherals have also a wakeup from Halt capability. Switching off the internal reference voltage reduces power consumption. Through software configuration it is also possible to wake up the device without waiting for the internal reference voltage wakeup time to have a fast wakeup time of 5  $\mu$ s.

## 3.2 Central processing unit STM8

### 3.2.1 Advanced STM8 Core

The 8-bit STM8 core is designed for code efficiency and performance with an Harvard architecture and a 3-stage pipeline.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing, and 80 instructions.

#### Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus - single cycle fetching most instructions
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter - 16 Mbyte linear memory space
- 16-bit stack pointer - access to a 64 Kbyte level stack
- 8-bit condition code register - 7 condition flags for the result of the last instruction

#### Addressing

- 20 addressing modes
- Indexed indirect addressing mode for lookup tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

#### Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

### 3.2.2 Interrupt controller

The high density and medium+ density STM8L15xx devices feature a nested vectored interrupt controller:

- Nested interrupts with 3 software priority levels
- 32 interrupt vectors with hardware priority
- Up to 40 external interrupt sources on 11 vectors
- Trap and reset interrupts

### 3.3 Reset and supply management

#### 3.3.1 Power supply scheme

The device requires a 1.65 V to 3.6 V operating supply voltage ( $V_{DD}$ ). The external power supply pins must be connected as follows:

- $V_{SS1}$ ,  $V_{DD1}$ ,  $V_{SS2}$ ,  $V_{DD2}$ ,  $V_{SS3}$ ,  $V_{DD3}$ ,  $V_{SS4}$ ,  $V_{DD4}$  = 1.65 to 3.6 V: external power supply for I/Os and for the internal regulator. Provided externally through  $V_{DD}$  pins, the corresponding ground pin is  $V_{SS}$ .  $V_{SS1}/V_{SS2}/V_{SS3}/V_{SS4}$  and  $V_{DD1}/V_{DD2}/V_{DD3}/V_{DD4}$  must not be left unconnected.
- $V_{SSA}$ ,  $V_{DDA}$  = 1.65 to 3.6 V: external power supplies for analog peripherals (minimum voltage to be applied to  $V_{DDA}$  is 1.8 V when the ADC1 is used).  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$ , respectively.
- $V_{REF+}$ ,  $V_{REF-}$  (for ADC1): external reference voltage for ADC1. Must be provided externally through  $V_{REF+}$  and  $V_{REF-}$  pin.
- $V_{REF+}$  (for DAC1/2): external voltage reference for DAC1 and DAC2 must be provided externally through  $V_{REF+}$ .

#### 3.3.2 Power supply supervisor

The device has an integrated ZEROPOWER power-on reset (POR)/power-down reset (PDR). For the device sales types without the “D” option (see [Section 11: Ordering information scheme](#)), it is coupled with a brownout reset (BOR) circuitry. In that case the device operates between 1.8 and 3.6 V, BOR is always active and ensures proper operation starting from 1.8 V. After the 1.8 V BOR threshold is reached, the option byte loading process starts, either to confirm or modify default thresholds, or to disable BOR permanently (in which case, the  $V_{DD}$  min. value at power-down is 1.65 V).

Five BOR thresholds are available through option bytes, starting from 1.8 V to 3 V. To reduce the power consumption in Halt mode, it is possible to automatically switch off the internal reference voltage (and consequently the BOR) in Halt mode. The device remains in reset state when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$  or  $V_{BOR}$ , without the need for any external reset circuit.

*Note:* For device sales types with the “D” option (see [Section 11: Ordering information scheme](#)) BOR is permanently disabled and the device operates between 1.65 and 3.6 V. In this case it is not possible to enable BOR through the option bytes.

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. This PVD offers 7 different levels between 1.85 V and 3.05 V, chosen by software, with a step around 200 mV. An interrupt can be generated when  $V_{DD}/V_{DDA}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}/V_{DDA}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.3.3 Voltage regulator

The high density and medium+ density STM8L15xx devices embed an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes:

- Main voltage regulator mode (MVR) for Run, Wait for interrupt (WFI) and Wait for event (WFE) modes.
- Low power voltage regulator mode (LPVR) for Halt, Active-halt, Low power run and Low power wait modes.

When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

## 3.4 Clock management

The clock controller distributes the system clock (SYSCLK) coming from different oscillators to the core and the peripherals. It also manages clock gating for low power modes and ensures clock robustness.

### Features

- **Clock prescaler:** to get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler
- **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock sources:** 4 different clock sources can be used to drive the system clock:
  - 1-16 MHz High speed external crystal (HSE)
  - 16 MHz High speed internal RC oscillator (HSI)
  - 32.768 Low speed external crystal (LSE)
  - 38 kHz Low speed internal RC (LSI)
- **RTC and LCD clock sources:** the above four sources can be chosen to clock the RTC and the LCD, whatever the system clock.
- **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** This feature can be enabled by software. If a HSE clock failure occurs, the system clock is automatically switched to HSI.
- **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

### 3.9 Analog-to-digital converter

- 12-bit analog-to-digital converter (ADC1) with 28 channels (including 4 fast channel), temperature sensor and internal reference voltage
- Conversion time down to 1  $\mu$ s with  $f_{\text{SYSCLK}} = 16$  MHz
- Programmable resolution
- Programmable sampling time
- Single and continuous mode of conversion
- Scan capability: automatic conversion performed on a selected group of analog inputs
- Analog watchdog: interrupt generation when the converted voltage is outside the programmed threshold
- Triggered by timer

*Note:* ADC1 can be served by DMA1.

### 3.10 Digital-to-analog converter

- 12-bit DAC with 2 buffered outputs (two digital signals can be converted into two analog voltage signal outputs)
- Synchronized update capability using timers
- DMA capability for each channel
- External triggers for conversion
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channels with independent or simultaneous conversions
- Input reference voltage  $V_{\text{REF+}}$  for better resolution

*Note:* DAC can be served by DMA1.

### 3.11 Ultralow power comparators

The high density and medium+ density STM8L15xx devices embed two comparators (COMP1 and COMP2) sharing the same current bias and voltage reference. The voltage reference can be internal or external (coming from an I/O).

- One comparator with fixed threshold (COMP1).
- One comparator rail to rail with fast or slow mode (COMP2). The threshold can be one of the following:
  - DAC output
  - External I/O
  - Internal reference voltage or internal reference voltage submultiple (1/4, 1/2, 3/4)

The two comparators can be used together to offer a window function. They can wake up from Halt mode.

### 3.12 System configuration controller and routing interface

The system configuration controller provides the capability to remap some alternate functions on different I/O ports. TIM4 and ADC1 DMA channels can also be remapped.

The highly flexible routing interface allows application software to control the routing of different I/Os to the TIM1 timer input captures. It also controls the routing of internal analog signals to ADC1, COMP1, COMP2, DAC1 and the internal reference voltage  $V_{REFINT}$ . Finally, it provides a set of registers for efficiently managing a set of dedicated I/Os supporting up to 16 capacitive sensing channels using the ProxSense™ technology.

### 3.13 Timers

The high density and medium+ density STM8L15xx devices contain one advanced control timer (TIM1), three 16-bit general purpose timers (TIM2, TIM3 and TIM5) and one 8-bit basic timer (TIM4).

All the timers can be served by DMA1.

[Table 3](#) compares the features of the advanced control, general-purpose and basic timers.

**Table 3. Timer feature comparison**

Timer	Counter resolution	Counter type	Prescaler factor	DMA1 request generation	Capture/compare channels	Complementary outputs
TIM1	16-bit	up/down	Any integer from 1 to 65536	Yes	3 + 1	3
TIM2			Any power of 2 from 1 to 128		2	None
TIM3						
TIM5						
TIM4	8-bit	up	Any power of 2 from 1 to 32768		0	

#### 3.13.1 16-bit advanced control timer (TIM1)

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver.

- 16-bit up, down and up/down autoreload counter with 16-bit prescaler
- 3 independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- 1 additional capture/compare channel which is not connected to an external I/O
- Synchronization module to control the timer with external signals
- Break input to force timer outputs into a defined state
- 3 complementary outputs with adjustable dead time
- Encoder mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)

### 3.13.2 16-bit general purpose timers (TIM2, TIM3, TIM5)

- 16-bit autoreload (AR) up/down-counter
- 7-bit prescaler adjustable to fixed power of 2 ratios (1...128)
- 2 individually configurable capture/compare channels
- PWM mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)
- Synchronization with other timers or external signals (external clock, reset, trigger and enable)

### 3.13.3 8-bit basic timer (TIM4)

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow or for DAC trigger generation.

## 3.14 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

### 3.14.1 Window watchdog timer

The window watchdog (WWDG) is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

### 3.14.2 Independent watchdog timer

The independent watchdog peripheral (IWDG) can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the internal LSI RC clock source, and thus stays active even in case of a CPU clock failure.

## 3.15 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

## 3.16 Communication interfaces

### 3.16.1 SPI

The serial peripheral interfaces (SPI1 and SPI2) provide half/ full duplex synchronous serial communication with external devices.

- Maximum speed: 8 Mbit/s ( $f_{\text{SYSCLK}}/2$ ) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on 2 lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- Hardware CRC calculation
- Slave/master selection input pin

*Note:* SPI1 and SPI2 can be served by the DMA1 Controller.

### 3.16.2 I<sup>2</sup>C

The I<sup>2</sup>C bus interface (I2C1) provides multi-master capability, and controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing.

- Master, slave and multi-master capability
- Standard mode up to 100 kHz and fast speed modes up to 400 kHz.
- 7-bit and 10-bit addressing modes.
- SMBus 2.0 and PMBus support
- Hardware CRC calculation

*Note:* I<sup>2</sup>C1 can be served by the DMA1 Controller.

### 3.16.3 USART

The USART interfaces (USART1, USART2 and USART3) allow full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

- 1 Mbit/s full duplex SCI
- SPI1 emulation
- High precision baud rate generator
- Smartcard emulation
- IrDA SIR encoder decoder
- Single wire half duplex mode

*Note:* USART1, USART2 and USART3 can be served by the DMA1 Controller.

## 3.17 Infrared (IR) interface

The high density and medium+ density STM8L15xx devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

## 3.18 Development support

### Development tools

Development tools for the STM8 microcontrollers include:

- The STIce emulation system offering tracing and code profiling
- The STVD high-level language debugger including C compiler, assembler and integrated development environment
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

### Single wire data interface (SWIM) and debug module

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The Single wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, CPU operation can also be monitored in real-time by means of shadow registers.

### Bootloader

A bootloader is available to reprogram the Flash memory using the USART1, USART2, USART3 (USARTs in asynchronous mode), SPI1 or SPI2 interfaces.

Table 5. High density and medium+ density STM8L15x pin description (continued)

Pin number			Pin name	Type	I/O level	Input			Output			Main function (after reset)	Default alternate function
LQFP80	LQFP64	UQFPN48 and LQFP48				floating	wpu	Ext. interrupt	High sink/source	OD	PP		
13	9	-	$V_{SSA}/V_{REF-}$	S								Analog ground voltage / ADC1 negative voltage reference	
37	29	-	$V_{DD3}$	S								I/Os supply voltage	
38	30	-	$V_{SS3}$	S								I/Os ground voltage	
5	1	1	PA0 <sup>(8)</sup> /[USART1_CK] <sup>(2)</sup> /SWIM/BEEP/IR_TIM <sup>(9)</sup>	I/O		X	X	X	HS	X	X	<b>Port A0</b> [USART1 synchronous clock] <sup>(2)</sup> / SWIM input and output / BEEP output / Infrared Timer output	
68	56	40	$V_{SS2}$									I/Os ground voltage	
67	55	39	$V_{DD2}$									I/Os supply voltage	
48	-	-	$V_{SS4}$									I/Os ground voltage	
47	-	-	$V_{DD4}$									I/Os supply voltage	

- At power-up, the PA1/NRST pin is a reset input pin with pull-up. To be used as a general purpose pin (PA1), it can be configured only as output open-drain or push-pull, not as a general purpose input. Refer to Section *Configuring NRST/PA1 pin as general purpose output* in the STM8L15xx and STM8L16xx reference manual (RM0031).
- [ ] Alternate function remapping option (if the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).
- Available on STM8L152xx devices only.
- A pull-up is applied to PB0 and PB4 during the reset phase. These two pins are input floating after reset release.
- In the 5 V tolerant I/Os, the protection diode to  $V_{DD}$  is not implemented.
- In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, weak pull-up and protection diode to  $V_{DD}$  are not implemented).
- Available on STM8L152xx devices only. On STM8L151xx devices it is reserved and must be tied to  $V_{DD}$ .
- The PA0 pin is in input pull-up during the reset phase and after reset release.
- High Sink LED driver capability available on PA0.

### System configuration options

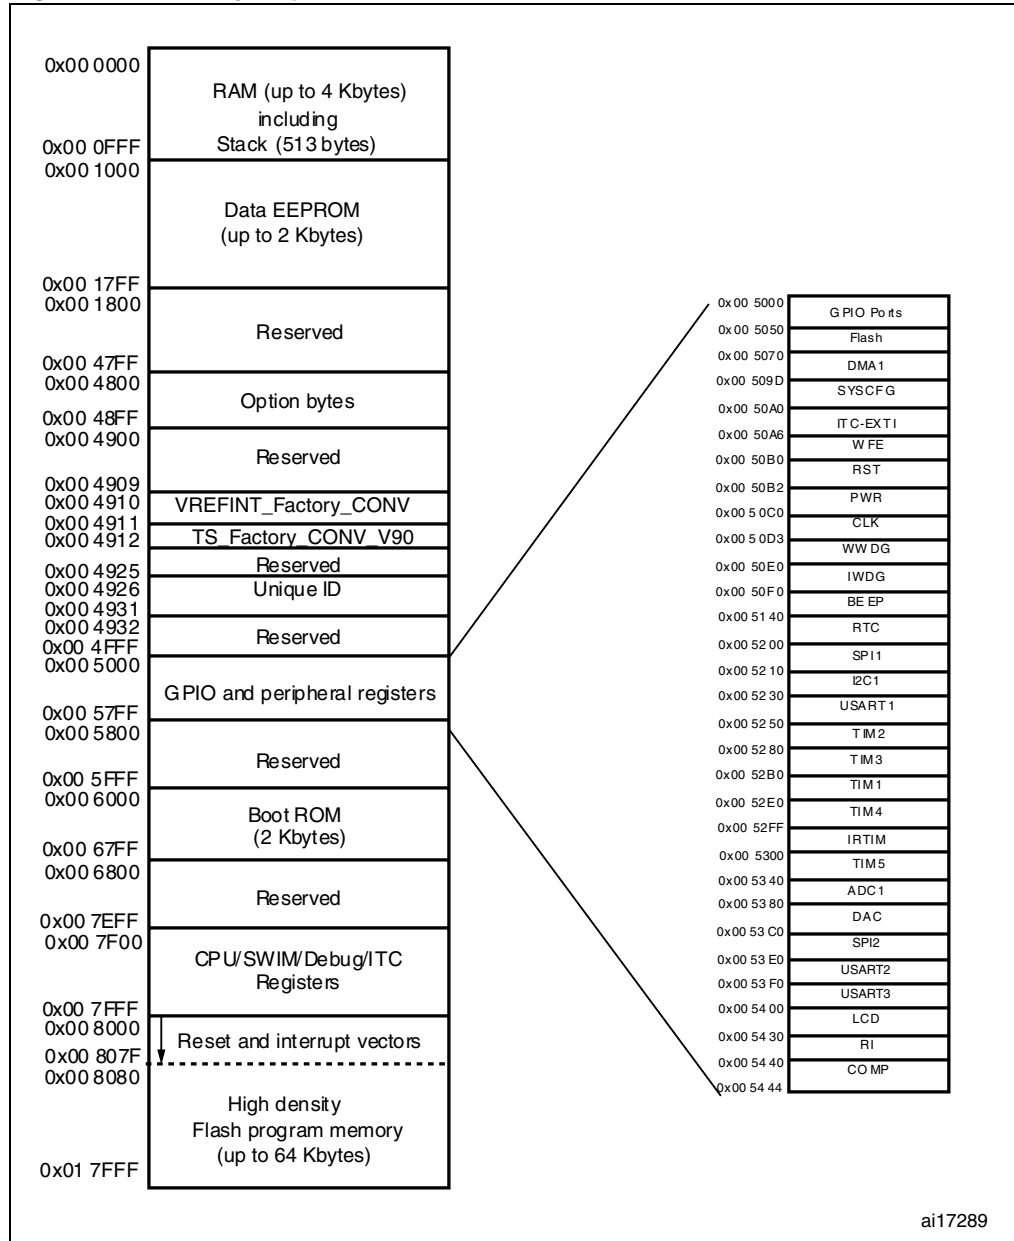

As shown in [Table 5: High density and medium+ density STM8L15x pin description](#), some alternate functions can be remapped on different I/O ports by programming one of the two remapping registers described in the "Routing interface (RI) and system configuration controller" section in the STM8L15xx and STM8L16xx reference manual (RM0031).

## 5 Memory and register map

### 5.1 Memory mapping

The memory map is shown in [Figure 9](#).

**Figure 9. Memory map**

ai17289

1. Refer to [Table 9](#) for an overview of hardware register mapping, to [Table 8](#) for details on I/O port hardware registers, and to [Table 10](#) for information on CPU/SWIM/debug module controller registers.

Table 6. Flash and RAM boundary addresses

Memory area	Size	Start address	End address
RAM	2 Kbytes	0x00 0000	0x00 07FF
	4 Kbytes	0x00 0000	0x00 0FFF
Flash program memory	32 Kbytes	0x00 8000	0x00 FFFF
	64 Kbytes	0x00 8000	0x01 7FFF

## 5.2 Register map

Table 7. Factory conversion registers

Address	Block	Register label	Register name	Reset status
0x00 4910	-	VREFINT_Factory_CONV <sup>(1)</sup>	Internal reference voltage factory conversion	0xXX
0x00 4911	-	TS_Factory_CONV_V90 <sup>(2)</sup>	Temperature sensor output voltage	0xXX

1. The VREFINT\_Factory\_CONV byte represents the 8 LSB of the result of the VREFINT 12-bit ADC conversion performed in factory. The 2 MSB have a fixed value: 0x6.
2. The TS\_Factory\_CONV\_V90 byte represents the 8 LSB of the result of the V90 12-bit ADC conversion performed in factory. The 2 MSB have a fixed value: 0x3.

Table 8. I/O port hardware register map

Address	Block	Register label	Register name	Reset status
0x00 5000	Port A	PA_ODR	Port A data output latch register	0x00

29	I <sup>2</sup> C1/SPI2	I <sup>2</sup> C1 interrupt <sup>(5)</sup> / SPI2	Yes	Yes	Yes	Yes <sup>(3)</sup>	0x00 807C

1. The Low power wait mode is entered when executing a WFE instruction in Low power run mode.
2. The TLI interrupt is the logic OR between TIM2 overflow interrupt, and TIM4 overflow interrupts.
3. In WFE mode, this interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. When this interrupt is configured as a wakeup event, the CPU wakes up and resumes processing.
4. The interrupt from PVD is logically OR-ed with Port E and F interrupts. Register EXTI\_CONF allows to select between Port E and Port F interrupt (see [External interrupt port select register \(EXTI\\_CONF\)](#) in the RM0031).
5. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

## 7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated memory block.

All option bytes can be modified in ICP mode (with SWIM) by accessing the EEPROM address. See [Table 12](#) for details on option byte addresses.

The option bytes can also be modified 'on the fly' by the application in IAP mode, except for the ROP, UBC and PCODESIZE values which can only be taken into account when they are modified in ICP mode (with the SWIM).

Refer to the STM8L15x/STM8L16x Flash programming manual (PM0054) and STM8 SWIM and Debug Manual (UM0320) for information on SWIM programming procedures.

**Table 12. Option byte addresses**

Address	Option name	Option byte No.	Option bits								Factory default setting
			7	6	5	4	3	2	1	0	
00 4800	Read-out protection (ROP)	OPT0	ROP[7:0]								0x00
00 4802	UBC (User Boot code size)	OPT1	UBC[7:0]								0x00
00 4807	PCODESIZE	OPT2	PCODE[7:0]								0x00
00 4808	Independent watchdog option	OPT3 [3:0]	Reserved				WWDG _HALT	WWDG _HW	IWDG _HALT	IWDG _HW	0x00
00 4809	Number of stabilization clock cycles for HSE and LSE oscillators	OPT4	Reserved				LSECNT[1:0]		HSECNT[1:0]		0x00
00 480A	Brownout reset (BOR)	OPT5 [3:0]	Reserved				BOR_TH		BOR_ON	0x01	
00 480B	Bootloader option bytes (OPTBL)	OPTBL [15:0]	OPTBL[15:0]								0x00
00 480C											0x00

Table 13. Option byte description

Option byte no.	Option description
OPT0	<b>ROP[7:0]</b> Memory readout protection (ROP) 0xAA: Disable readout protection (write access via SWIM protocol) Refer to Readout protection section in the STM8L reference manual (RM0031).
OPT1	<b>UBC[7:0]</b> Size of the user boot code area UBC[7:0] Size of the user boot code area 0x00: No UBC 0x01: Page 0 reserved for the UBC and write protected. ... 0xFF: Page 0 to 254 reserved for the UBC and write-protected. Refer to User boot code section in the STM8L reference manual (RM0031).
OPT2	<b>PCODESIZE[7:0]</b> Size of the proprietary code area 0x00: No proprietary code area 0x01: Page 0 reserved for the proprietary code and read/write protected. ... 0xFF: Page 0 to 254 reserved for the proprietary code and read/write protected. Refer to Proprietary code area (PCODE) section in the STM8L reference manual (RM0031) for more details.
OPT3	<b>IWDG_HW</b> : Independent watchdog 0: Independent watchdog activated by software 1: Independent watchdog activated by hardware
	<b>IWDG_HALT</b> : Independent watchdog off in Halt/Active-halt 0: Independent watchdog continues running in Halt/Active-halt mode 1: Independent watchdog stopped in Halt/Active-halt mode
	<b>WWDG_HW</b> : Window watchdog 0: Window watchdog activated by software 1: Window watchdog activated by hardware
	<b>WWDG_HALT</b> : Window window watchdog reset on Halt/Active-halt 0: Window watchdog stopped in Halt mode 1: Window watchdog generates a reset when MCU enters Halt mode
OPT4	<b>HSECNT</b> : Number of HSE oscillator stabilization clock cycles 0x00 - 1 clock cycle 0x01 - 16 clock cycles 0x10 - 512 clock cycles 0x11 - 4096 clock cycles
	<b>LSECNT</b> : Number of LSE oscillator stabilization clock cycles 0x00 - 1 clock cycle 0x01 - 16 clock cycles 0x10 - 512 clock cycles 0x11 - 4096 clock cycles

**Table 13. Option byte description (continued)**

Option byte no.	Option description
OPT5	<b>BOR_ON:</b> 0: Brownout reset off 1: Brownout reset on
	<b>BOR_TH[3:1]:</b> Brownout reset thresholds. Refer to <a href="#">Table 20</a> for details on the thresholds according to the value of BOR_TH bits.
OPTBL	<b>OPTBL[15:0]:</b> This option is checked by the boot ROM code after reset. Depending on the content of addresses 00 480B, 00 480C and 0x8000 (reset vector) the CPU jumps to the bootloader or to the reset vector. Refer to the UM0560 bootloader user manual for more details.

## 9 Electrical parameters

### 9.1 Parameter conditions

Unless otherwise specified, all voltages are referred to  $V_{SS}$ .

#### 9.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^\circ\text{C}$  and  $T_A = T_A \text{ max}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\sigma$ ).

#### 9.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^\circ\text{C}$ ,  $V_{DD} = 3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\sigma$ ).

#### 9.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 9.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 10](#).

**Figure 10. Pin loading conditions**

Table 16. Current characteristics

Symbol	Ratings	Max.	Unit
$I_{VDD}$	Total current into $V_{DD}$ power line (source)	80	mA
$I_{VSS}$	Total current out of $V_{SS}$ ground line (sink)	80	
$I_{IO}$	Output current sunk by IR_TIM pin (with high sink LED driver capability)	80	
	Output current sunk by any other I/O and control pin	25	
	Output current sourced by any I/Os and control pin	- 25	
$I_{INJ(PIN)}$	Injected current on true open-drain pins (PC0 and PC1) <sup>(1)</sup>	- 5 / +0	
	Injected current on five-volt tolerant (FT) pins <sup>(1)</sup>	- 5 / +0	
	Injected current on any other pin <sup>(2)</sup>	- 5 / +5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) <sup>(3)</sup>	$\pm 25$	

1. Positive injection is not possible on these I/Os. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 15](#) for maximum allowed input voltage values.
2. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 15](#) for maximum allowed input voltage values.
3. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 17. Thermal characteristics

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to +150	°C
$T_J$	Maximum junction temperature	150	

Table 20. Total current consumption in Run mode (continued)

Symbol	Parameter	Conditions <sup>(1)</sup>	Typ.	Max.				Unit

$I_{DD}(PVD/BOR)$	Power voltage detector and brownout Reset unit supply current <sup>(7)</sup>	2.6		
$I_{DD}(BOR)$	Brownout Reset unit supply current <sup>(7)</sup>	2.4		
$I_{DD}(IDWDG)$	Independent watchdog supply current	including LSI supply current		0.45
		excluding LSI supply current	0.05	

1. Data based on a differential  $I_{DD}$  measurement between all peripherals OFF and a timer counter running at 16 MHz. The CPU is in Wait mode in both cases. No IC/OC programmed, no I/O pins toggling. Not tested in production.
2. Data based on a differential  $I_{DD}$  measurement between the on-chip peripheral in reset configuration and not clocked and the on-chip peripheral when clocked and not kept under reset. The CPU is in Wait mode in both cases. No I/O pins toggling. Not tested in production.
3. Peripherals listed above the  $I_{DD}(ALL)$  parameter ON: TIM1, TIM2, TIM3, TIM4, TIM5, USART1, USART2, USART3, SPI1, SPI2, I2C1, DMA1, WWDG.
4. Data based on a differential  $I_{DD}$  measurement between ADC in reset configuration and continuous ADC conversion.

5. Data based on a differential  $I_{DD}$  measurement between DAC in reset configuration and continuous DAC conversion of  $V_{DD}/2$ . Floating DAC output.
6. Data based on a differential  $I_{DD}$  measurement between COMP1 or COMP2 in reset configuration and COMP1 or COMP2 enabled with static inputs. Supply current of internal reference voltage excluded.
7. Including supply current of internal reference voltage.

**Table 28. Current consumption under external reset**

Symbol	Parameter	Conditions	Typ.	Unit	
$I_{DD(RST)}$	Supply current under external reset <sup>(1)</sup>	PB1/PB3/PA5 pins are externally tied to $V_{DD}$	$V_{DD} = 1.8\text{ V}$	48	$\mu\text{A}$
			$V_{DD} = 3\text{ V}$	80	
			$V_{DD} = 3.6\text{ V}$	95	

1. All pins except PA0, PB0 and PB4 are floating under reset. PA0, PB0 and PB4 are configured with pull-up under reset. PB1, PB3 and PA5 must be tied externally under reset to avoid the consumption due to their schmitt trigger.

### 9.3.4 Clock and timing characteristics

#### HSE external clock (HSEBYP = 1 in CLK\_ECKCR)

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

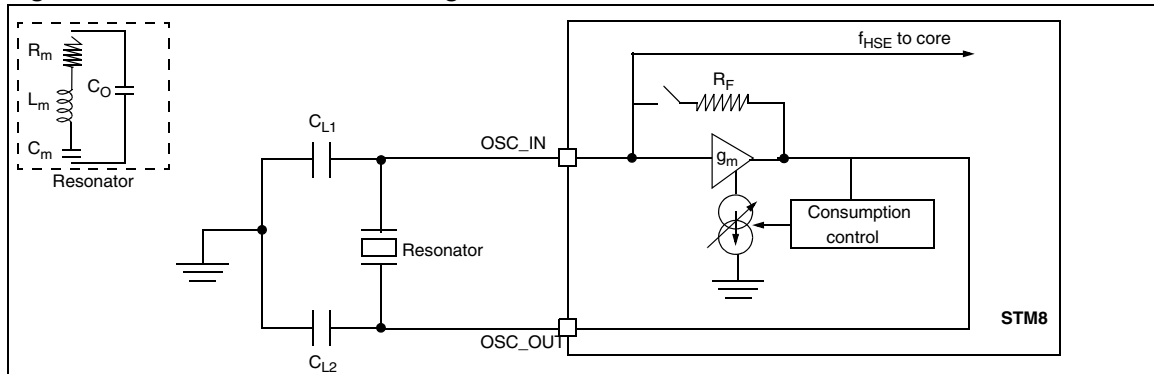

**Table 29. HSE external clock characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$f_{HSE\_ext}^{(1)}$	External clock source frequency		1		16	MHz
$V_{HSEH}$	OSC_IN input pin high level voltage		$0.7 \times V_{DD}$		$V_{DD}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage		$V_{SS}$		$0.3 \times V_{DD}$	
$C_{in(HSE)}^{(1)}$	OSC_IN input capacitance			2.6		pF
$I_{LEAK\_HSE}$	OSC_IN input leakage current	$V_{SS} < V_{IN} < V_{DD}$			$\pm 1$	$\mu\text{A}$

1. Guaranteed by design, not tested in production.

Figure 21. HSE oscillator circuit diagram

### HSE oscillator critical $g_m$ formula

$$g_{m\text{crit}} = (2 \times \pi \times f_{\text{HSE}})^2 \times R_m (2C_o + C)^2$$

$R_m$ : Motional resistance (see crystal specification),  $L_m$ : Motional inductance (see crystal specification),  
 $C_m$ : Motional capacitance (see crystal specification),  $C_o$ : Shunt capacitance (see crystal specification),  
 $C_{L1}=C_{L2}=C$ : Grounded external capacitance  
 $g_m \gg g_{m\text{crit}}$

### LSE crystal/ceramic resonator oscillator

The LSE is available on STM8L151xx and STM8L152xx devices only.

The LSE clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

Table 32. LSE oscillator characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$f_{\text{LSE}}$	Low speed external oscillator frequency			32.768		kHz
$R_F$	Feedback resistor	$\Delta V = 200 \text{ mV}$		1.2		$M\Omega$
$C^{(1)(2)}$	Recommended load capacitance			8		pF
$I_{\text{DD(LSE)}}$	LSE oscillator power consumption	$V_{\text{DD}} = 1.8 \text{ V}$		450		nA
		$V_{\text{DD}} = 3 \text{ V}$		600		
		$V_{\text{DD}} = 3.6 \text{ V}$		750		
$g_m$	Oscillator transconductance		$3^{(3)}$			$\mu\text{A/V}$
$t_{\text{SU(LSE)}}^{(4)}$	Startup time	$V_{\text{DD}}$ is stabilized		1		s

- $C=C_{L1}=C_{L2}$  is approximately equivalent to 2 x crystal  $C_{\text{LOAD}}$ .
- The oscillator selection can be optimized in terms of supply current using a high quality resonator with a small  $R_m$  value. Refer to crystal manufacturer for more details.
- Guaranteed by design. Not tested in production.
- $t_{\text{SU(LSE)}}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Figure 23. Typical HSI frequency vs.  $V_{DD}$ 

### Low speed internal RC oscillator (LSI)

In the following table, data are based on characterization results, not tested in production.

Table 34. LSI oscillator characteristics

Symbol	Parameter	Conditions <sup>(1)</sup>	Min.	Typ.	Max.	Unit
$f_{LSI}$	Frequency		26	38	56	kHz
$t_{su(LSI)}$	LSI oscillator wakeup time				200 <sup>(2)</sup>	$\mu$ s
$D_{(LSI)}$	LSI oscillator frequency drift <sup>(3)</sup>	$0\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$	-12		11	%

1.  $V_{DD} = 1.65\text{ V to }3.6\text{ V}$ ,  $T_A = -40\text{ to }125\text{ }^{\circ}\text{C}$  unless otherwise specified.

2. Guaranteed by Design, not tested in production.

3. This is a deviation for an individual part, once the initial frequency has been measured.

Figure 24. Typical LSI clock source frequency vs.  $V_{DD}$

### 9.3.5 Memory characteristics

$T_A = -40$  to  $125$  °C unless otherwise specified.

Table 35. RAM and hardware registers

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{RM}$	Data retention mode <sup>(1)</sup>	Halt mode (or Reset)	1.65			V

1. Minimum supply voltage without losing data stored in RAM (in Halt mode or under Reset) or in hardware registers (only in Halt mode). Guaranteed by characterization, not tested in production.

## Flash memory

Table 36. Flash program and data EEPROM memory

Symbol	Parameter	Conditions	Min.	Typ.	Max. (1)	Unit
$V_{DD}$	Operating voltage (all modes, read/write/erase)	$f_{SYSCLK} = 16 \text{ MHz}$	1.65		3.6	V
$t_{prog}$	Programming time for 1 or 128 bytes (block) erase/write cycles (on programmed byte)			6		ms
	Programming time for 1 to 128 bytes (block) write cycles (on erased byte)			3		ms
$I_{prog}$	Programming/ erasing consumption	$T_A = +25 \text{ }^\circ\text{C}$ , $V_{DD} = 3.0 \text{ V}$		0.7		mA
		$T_A = +25 \text{ }^\circ\text{C}$ , $V_{DD} = 1.8 \text{ V}$				
$t_{RET}^{(2)}$	Data retention (program memory) after 10000 erase/write cycles at $T_A = -40 \text{ }^\circ\text{C}$ to $+85 \text{ }^\circ\text{C}$ (6 suffix)	$T_{RET} = +85 \text{ }^\circ\text{C}$	$30^{(1)}$			years
	Data retention (program memory) after 10000 erase/write cycles at $T_A = -40 \text{ }^\circ\text{C}$ to $+125 \text{ }^\circ\text{C}$ (3 suffix)	$T_{RET} = +125 \text{ }^\circ\text{C}$	$5^{(1)}$			
	Data retention (data memory) after 300000 erase/write cycles at $T_A = -40 \text{ }^\circ\text{C}$ to $+85 \text{ }^\circ\text{C}$ (6 suffix)	$T_{RET} = +85 \text{ }^\circ\text{C}$	$30^{(1)}$			
	Data retention (data memory) after 300000 erase/write cycles at $T_A = -40 \text{ }^\circ\text{C}$ to $+125 \text{ }^\circ\text{C}$ (3 suffix)	$T_{RET} = +125 \text{ }^\circ\text{C}$	$5^{(1)}$			
$N_{RW}^{(3)}$	Erase/write cycles (program memory)	$T_A = -40 \text{ }^\circ\text{C}$ to $+85 \text{ }^\circ\text{C}$ (6 suffix), $T_A = -40 \text{ }^\circ\text{C}$ to $+105 \text{ }^\circ\text{C}$ (7 suffix) or $T_A = -40 \text{ }^\circ\text{C}$ to $+125 \text{ }^\circ\text{C}$ (3 suffix)	$10^{(1)}$			kcycles
	Erase/write cycles (data memory)		$300^{(1)}$ <sup>(4)</sup>			

1. Data based on characterization results, not tested in production.
2. Conforming to JEDEC JESD22a117
3. The physical granularity of the memory is 4 bytes, so cycling is performed on 4 bytes even when a write/erase operation addresses a single byte.
4. Data based on characterization performed on the whole data memory.

### 9.3.6 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error, out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation, LCD levels, etc.).

The test results are given in the following table.

**Table 37. I/O current injection susceptibility**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
$I_{INJ}$	Injected current on true open-drain pins	-5	+0	mA
	Injected current on all 5 V tolerant (FT) pins	-5	+0	
	Injected current on any other pin	-5	+5	

### 9.3.7 I/O port pin characteristics

#### General characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 38. I/O static characteristics

Symbol	Parameter	Conditions <sup>(1)</sup>	Min.	Typ.	Max.	Unit
V <sub>IL</sub>	Input low level voltage <sup>(2)</sup>	Input voltage on true open-drain pins (PC0 and PC1)	V <sub>SS</sub> -0.3		0.3 x V <sub>DD</sub>	V
		Input voltage on five-volt tolerant (FT) pins	V <sub>SS</sub> -0.3		0.3 x V <sub>DD</sub>	
		Input voltage on any other pin	V <sub>SS</sub> -0.3		0.3 x V <sub>DD</sub>	
V <sub>IH</sub>	Input high level voltage <sup>(2)</sup>	Input voltage on true open-drain pins (PC0 and PC1) with V <sub>DD</sub> < 2 V	0.70 x V <sub>DD</sub>		5.2	V
		Input voltage on true open-drain pins (PC0 and PC1) with V <sub>DD</sub> ≥ 2 V			5.5	
		Input voltage on five-volt tolerant (FT) pins with V <sub>DD</sub> < 2 V	0.70 x V <sub>DD</sub>		5.2	
		Input voltage on five-volt tolerant (FT) pins with V <sub>DD</sub> ≥ 2 V			5.5	
		Input voltage on any other pin	0.70 x V <sub>DD</sub>		V <sub>DD</sub> +0.3	
V <sub>hys</sub>	Schmitt trigger voltage hysteresis <sup>(3)</sup>	Standard I/Os		200		mV
		True open drain I/Os		200		
I <sub>lkg</sub>	Input leakage current <sup>(4)</sup>	V <sub>SS</sub> ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> Standard I/Os	-	-	50 <sup>(5)</sup>	nA
		V <sub>SS</sub> ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> True open drain I/Os	-	-	200 <sup>(5)</sup>	
		V <sub>SS</sub> ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> PA0 with high sink LED driver capability	-	-	200 <sup>(5)</sup>	
R <sub>PU</sub>	Weak pull-up equivalent resistor <sup>(2)(6)</sup>	V <sub>IN</sub> =V <sub>SS</sub>	30	45	60	kΩ
C <sub>IO</sub>	I/O pin capacitance			5		pF

1. V<sub>DD</sub> = 3.0 V, T<sub>A</sub> = -40 to 125 °C unless otherwise specified.

2. Data based on characterization results, not tested in production.

3. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested.

4. The max. value may be exceeded if negative current is injected on adjacent pins.

5. Not tested in production.

6. R<sub>PU</sub> pull-up equivalent resistor based on a resistive transistor (corresponding I<sub>PU</sub> current characteristics described in [Figure 28](#)).

Figure 28. Typical pull-up current  $I_{DU}$  vs.  $V_{DD}$  with  $V_{IN}=V_{SS}$ 

### Output driving current

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified.

Table 39. Output driving current (high sink ports)

I/O Type	Symbol	Parameter	Conditions	Min.	Max.	Unit
Standard	$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +2 \text{ mA}$ , $V_{DD} = 3.0 \text{ V}$		0.45	V
			$I_{IO} = +2 \text{ mA}$ , $V_{DD} = 1.8 \text{ V}$		0.45	V
			$I_{IO} = +10 \text{ mA}$ , $V_{DD} = 3.0 \text{ V}$		0.7	V
	$V_{OH}^{(2)}$	Output high level voltage for an I/O pin	$I_{IO} = -2 \text{ mA}$ , $V_{DD} = 3.0 \text{ V}$	$V_{DD}-0.45$		V
			$I_{IO} = -1 \text{ mA}$ , $V_{DD} = 1.8 \text{ V}$	$V_{DD}-0.45$		V
			$I_{IO} = -10 \text{ mA}$ , $V_{DD} = 3.0 \text{ V}$	$V_{DD}-0.7$		V

- The  $I_{IO}$  current sunk must always respect the absolute maximum rating specified in Table 16 and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .
- The  $I_{IO}$  current sourced must always respect the absolute maximum rating specified in Table 16 and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VDD}$ .

**Table 40. Output driving current (true open drain ports)**

I/O Type	Symbol	Parameter	Conditions	Min.	Max.	Unit
Open drain	$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +3 \text{ mA}$ , $V_{DD} = 3.0 \text{ V}$		0.45	V
			$I_{IO} = +1 \text{ mA}$ , $V_{DD} = 1.8 \text{ V}$		0.45	

1. The  $I_{IO}$  current sunk must always respect the absolute maximum rating specified in [Table 16](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .

**Table 41. Output driving current (PA0 with high sink LED driver capability)**

I/O Type	Symbol	Parameter	Conditions	Min.	Max.	Unit
$\overline{\text{PE}}$	$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +20 \text{ mA}$ , $V_{DD} = 2.0 \text{ V}$		0.45	V

1. The  $I_{IO}$  current sunk must always respect the absolute maximum rating specified in [Table 16](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .

**Figure 29. Typical  $V_{OL}$  @  $V_{DD} = 3.0 \text{ V}$  (high sink ports)**

**Figure 30. Typical  $V_{OL}$  @  $V_{DD} = 1.8 \text{ V}$  (high sink ports)**

**Figure 31. Typical  $V_{OL}$  @  $V_{DD} = 3.0 \text{ V}$  (true open drain ports)**

**Figure 32. Typical  $V_{OL}$  @  $V_{DD} = 1.8 \text{ V}$  (true open drain ports)**

Figure 33. Typical  $V_{DD} - V_{OH}$  @  $V_{DD} = 3.0\text{ V}$   
(high sink ports)Figure 34. Typical  $V_{DD} - V_{OH}$  @  $V_{DD} = 1.8\text{ V}$   
(high sink ports)**NRST pin**

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified.

Table 42. NRST pin characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{IL}(\text{NRST})$	NRST input low level voltage <sup>(1)</sup>		$V_{SS}$		0.8	V
$V_{IH}(\text{NRST})$	NRST input high level voltage <sup>(1)</sup>		1.4		$V_{DD}$	
$V_{OL}(\text{NRST})$	NRST output low level voltage <sup>(1)</sup>	$I_{OL} = 2\text{ mA}$ for $2.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$			0.4	
		$I_{OL} = 1.5\text{ mA}$ for $V_{DD} < 2.7\text{ V}$				
$V_{HYST}$	NRST input hysteresis <sup>(3)</sup>		$10\%V_{DD}$ (2)			mV
$R_{PU}(\text{NRST})$	NRST pull-up equivalent resistor <sup>(1)</sup>		30	45	60	k $\Omega$
$V_F(\text{NRST})$	NRST input filtered pulse <sup>(3)</sup>				50	ns
$V_{NF}(\text{NRST})$	NRST input not filtered pulse <sup>(3)</sup>		300			

1. Data based on characterization results, not tested in production.
2. 200 mV min.
3. Data guaranteed by design, not tested in production.

### 9.3.8 Communication interfaces

#### SPI1 - Serial peripheral interface

Unless otherwise specified, the parameters given in [Table 43](#) are derived from tests performed under ambient temperature,  $f_{\text{SYSCLK}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Section 9.3.1](#). Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

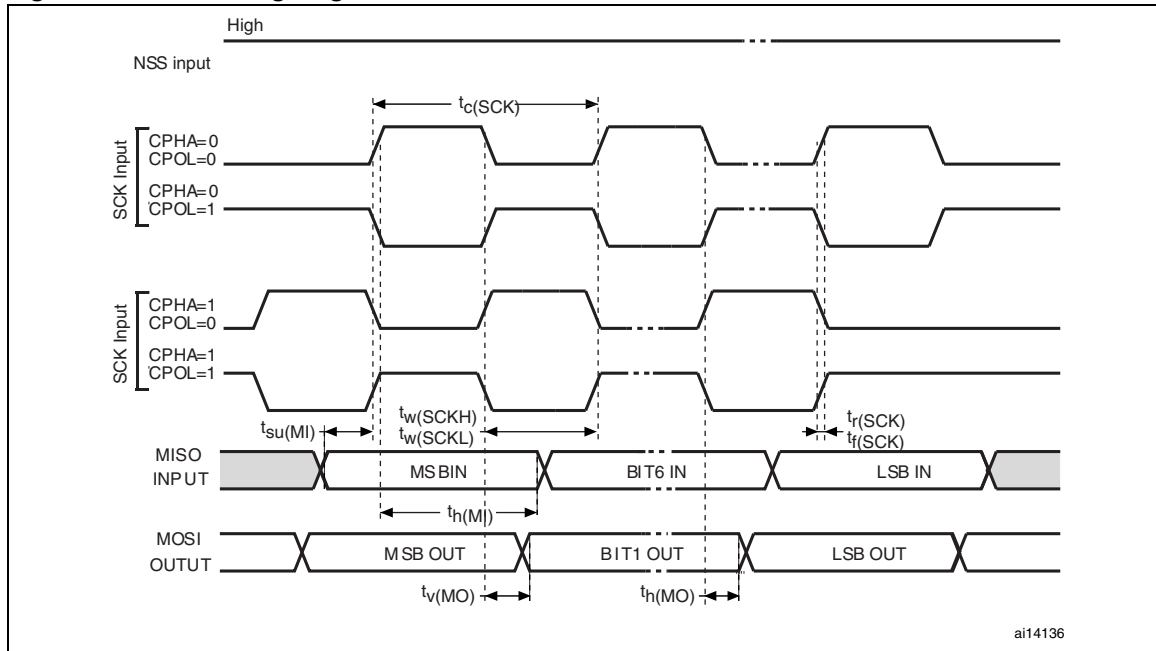

**Table 43. SPI1 characteristics**

Symbol	Parameter	Conditions <sup>(1)</sup>	Min.	Max.	Unit
$f_{\text{SCK}}$ $1/t_{\text{c(SCK)}}$	SPI1 clock frequency	Master mode	0	8	MHz
		Slave mode	0	8	
$t_{\text{r(SCK)}}$ $t_{\text{f(SCK)}}$	SPI1 clock rise and fall time	Capacitive load: C = 30 pF	-	30	ns
$t_{\text{su(NSS)}}^{(2)}$	NSS setup time	Slave mode	$4 \times 1/f_{\text{SYSCLK}}$	-	
$t_{\text{h(NSS)}}^{(2)}$	NSS hold time	Slave mode	80	-	
$t_{\text{w(SCKH)}}^{(2)}$ $t_{\text{w(SCKL)}}^{(2)}$	SCK high and low time	Master mode, $f_{\text{MASTER}} = 8 \text{ MHz}$ , $f_{\text{SCK}} = 4 \text{ MHz}$	105	145	
$t_{\text{su(MI)}}^{(2)}$ $t_{\text{su(SI)}}^{(2)}$	Data input setup time	Master mode	30	-	
		Slave mode	3	-	
$t_{\text{h(MI)}}^{(2)}$ $t_{\text{h(SI)}}^{(2)}$	Data input hold time	Master mode	15	-	
		Slave mode	0	-	
$t_{\text{a(SO)}}^{(2)(3)}$	Data output access time	Slave mode	-	$3 \times 1/f_{\text{SYSCLK}}$	
$t_{\text{dis(SO)}}^{(2)(4)}$	Data output disable time	Slave mode	30	-	
$t_{\text{v(SO)}}^{(2)}$	Data output valid time	Slave mode (after enable edge)	-	60	
$t_{\text{v(MO)}}^{(2)}$	Data output valid time	Master mode (after enable edge)	-	20	
$t_{\text{h(SO)}}^{(2)}$	Data output hold time	Slave mode (after enable edge)	15	-	
$t_{\text{h(MO)}}^{(2)}$		Master mode (after enable edge)	1	-	

- Parameters are given by selecting 10 MHz I/O output frequency.
- Values based on design simulation and/or characterization results, and not tested in production.
- Min. time is for the minimum time to drive the output and max. time is for the maximum time to validate the data.
- Min. time is for the minimum time to invalidate the output and max. time is for the maximum time to put the data in Hi-Z.

Figure 40. SPI1 timing diagram - master mode<sup>(1)</sup>

1. Measurement points are done at CMOS levels:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

## I<sup>2</sup>C - Inter IC control interface

Subject to general operating conditions for  $V_{DD}$ ,  $f_{SYSCLK}$ , and  $T_A$  unless otherwise specified.

The STM8L I<sup>2</sup>C interface (I2C1) meets the requirements of the Standard I<sup>2</sup>C communication protocol described in the following table with the restriction mentioned below:

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (SDA and SCL).

**Table 44. I2C characteristics**

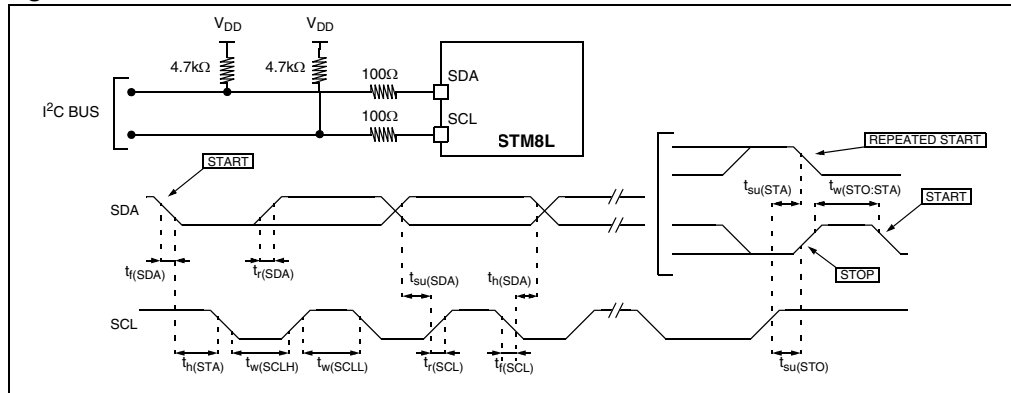

Symbol	Parameter	Standard mode I <sup>2</sup> C		Fast mode I <sup>2</sup> C <sup>(1)</sup>		Unit
		Min. <sup>(2)</sup>	Max. <sup>(2)</sup>	Min. <sup>(2)</sup>	Max. <sup>(2)</sup>	
$t_{w(SCLL)}$	SCL clock low time	4.7		1.3		$\mu$ s
$t_{w(SCLH)}$	SCL clock high time	4.0		0.6		
$t_{su(SDA)}$	SDA setup time	250		100		ns
$t_h(SDA)$	SDA data hold time	0		0	900	
$t_r(SDA)$ $t_r(SCL)$	SDA and SCL rise time		1000		300	
$t_f(SDA)$ $t_f(SCL)$	SDA and SCL fall time		300		300	
$t_h(STA)$	START condition hold time	4.0		0.6		$\mu$ s
$t_{su(STA)}$	Repeated START condition setup time	4.7		0.6		
$t_{su(STO)}$	STOP condition setup time	4.0		0.6		$\mu$ s
$t_w(STO:STA)$	STOP to START condition time (bus free)	4.7		1.3		$\mu$ s
$C_b$	Capacitive load for each bus line		400		400	pF

1.  $f_{SYSCLK}$  must be at least equal to 8 MHz to achieve max fast I<sup>2</sup>C speed (400 kHz).

2. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production.

**Note:** *For speeds around 200 kHz, the achieved speed can have a  $\pm 5\%$  tolerance.  
For other speed ranges, the achieved speed can have a  $\pm 2\%$  tolerance.  
The above variations depend on the accuracy of the external components used.*

Figure 41. Typical application with I<sup>2</sup>C bus and timing diagram <sup>1)</sup>

1. Measurement points are done at CMOS levels: 0.3 x V<sub>DD</sub> and 0.7 x V<sub>DD</sub>

### 9.3.9 LCD controller (STM8L152xx only)

In the following table, data are guaranteed by Design, not tested in production.

**Table 45. LCD characteristics**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{LCD}$	LCD external voltage			3.6	V
$V_{LCD0}$	LCD internal reference voltage 0		2.6		
$V_{LCD1}$	LCD internal reference voltage 1		2.7		
$V_{LCD2}$	LCD internal reference voltage 2		2.8		
$V_{LCD3}$	LCD internal reference voltage 3		3.0		
$V_{LCD4}$	LCD internal reference voltage 4		3.1		
$V_{LCD5}$	LCD internal reference voltage 5		3.2		
$V_{LCD6}$	LCD internal reference voltage 6		3.4		
$V_{LCD7}$	LCD internal reference voltage 7		3.5		
$C_{EXT}$	$V_{LCD}$ external capacitance	0.1	1	2	$\mu F$
$I_{DD}$	Supply current <sup>(1)</sup> at $V_{DD} = 1.8 V$		3		$\mu A$
	Supply current <sup>(1)</sup> at $V_{DD} = 3 V$		3		
$R_{HN}^{(2)}$	High value resistive network (low drive)		6.6		$M\Omega$
$R_{LN}^{(3)}$	Low value resistive network (high drive)		240		$k\Omega$
$V_{33}$	Segment/Common higher level voltage			$V_{LCDx}$	V
$V_{34}$	Segment/Common 3/4 level voltage		$3/4V_{LCDx}$		
$V_{23}$	Segment/Common 2/3 level voltage		$2/3V_{LCDx}$		
$V_{12}$	Segment/Common 1/2 level voltage		$1/2V_{LCDx}$		
$V_{13}$	Segment/Common 1/3 level voltage		$1/3V_{LCDx}$		
$V_{14}$	Segment/Common 1/4 level voltage		$1/4V_{LCDx}$		
$V_0$	Segment/Common lowest level voltage	0			

1. LCD enabled with 3 V internal booster (LCD\_CR1 = 0x08), 1/4 duty, 1/3 bias, division ratio= 64, all pixels active, no LCD connected.

2.  $R_{HN}$  is the total high value resistive network.

3.  $R_{LN}$  is the total low value resistive network.

#### VLCD external capacitor (STM8L152xx only)

The application can achieve a stabilized LCD reference voltage by connecting an external capacitor  $C_{EXT}$  to the  $V_{LCD}$  pin.  $C_{EXT}$  is specified in [Table 45](#).

### 9.3.10 Embedded reference voltage

In the following table, data are based on characterization results, not tested in production, unless otherwise specified.

**Table 46. Reference voltage characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$I_{REFINT}$	Internal reference voltage consumption			1.4		$\mu\text{A}$
$T_{S\_VREFINT}^{(1)(2)}$	ADC sampling time when reading the internal reference voltage			5	10	$\mu\text{s}$
$I_{BUF}^{(1)}$	Internal reference voltage buffer consumption (used for ADC)			13.5	25	$\mu\text{A}$
$V_{REFINT\ out}$	Reference voltage output		1.202 <sub>(3)</sub>	1.224	1.242 <sub>(3)</sub>	V
$I_{LPBUF}^{(1)}$	Internal reference voltage low power buffer consumption (used for comparators or output)			730	1200	nA
$I_{REFOUT}^{(1)(4)}$	Buffer output current				1	$\mu\text{A}$
$C_{REFOUT}$	Reference voltage output load				50	pF
$t_{VREFINT}^{(1)}$	Internal reference voltage startup time			2	3	ms
$t_{BUFEN}^{(1)(2)}$	Internal reference voltage buffer startup time once enabled				10	$\mu\text{s}$
$ACC_{VREFINT}^{(5)}$	Accuracy of $V_{REFINT}$ stored in the $VREFINT\_Factory\_CONV$ byte				$\pm 5$	mV
$STAB_{VREFINT}$	Stability of $V_{REFINT}$ over temperature	$-40\text{ }^{\circ}\text{C} \leq T_A \leq 125\text{ }^{\circ}\text{C}$		20	50	ppm/ $^{\circ}\text{C}$
	Stability of $V_{REFINT}$ over temperature	$0\text{ }^{\circ}\text{C} \leq T_A \leq 50\text{ }^{\circ}\text{C}$			20	ppm/ $^{\circ}\text{C}$
$STAB_{VREFINT}$	Stability of $V_{REFINT}$ after 1000 hours				TBD	ppm

1. Guaranteed by design, not tested in production
2. Defined when ADC output reaches its final value  $\pm 1/2\text{LSB}$
3. Tested in production at  $V_{DD} = 3\text{ V} \pm 10\text{ mV}$ .
4. To guarantee less than 1%  $V_{REFOUT}$  deviation
5. Measured at  $V_{DD} = 3\text{ V} \pm 10\text{ mV}$ . This value takes into account  $V_{DD}$  accuracy and ADC conversion accuracy.

### 9.3.11 Temperature sensor

In the following table, data are based on characterization results, not tested in production, unless otherwise specified.

**Table 47. TS characteristics**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{90}^{(1)}$	Sensor reference voltage at $90^{\circ}\text{C} \pm 5^{\circ}\text{C}$ ,	0.580	0.597	0.614	V
$T_L$	$V_{\text{SENSOR}}$ linearity with temperature		$\pm 1$	$\pm 2$	$^{\circ}\text{C}$
Avg_slope <sup>(2)</sup>	Average slope	1.59	1.62	1.65	mV/ $^{\circ}\text{C}$
$\text{IDD}_{(\text{TEMP})}^{(2)}$	Consumption		3.4	6	$\mu\text{A}$
$T_{\text{START}}^{(2)(3)}$	Temperature sensor startup time			10	$\mu\text{s}$
$T_{\text{S\_TEMP}}^{(2)}$	ADC sampling time when reading the temperature sensor		5	10	$\mu\text{s}$

1. Tested in production at  $V_{\text{DD}} = 3\text{ V} \pm 10\text{ mV}$ . The 8 LSB of the  $V_{90}$  ADC conversion result are stored in the TS\_Factory\_CONV\_V90 byte.

2. Guaranteed by design, not tested in production.

3. Defined for ADC output reaching its final value  $\pm 1/2\text{LSB}$ .

### 9.3.12 Comparator characteristics

In the following table, data are guaranteed by design, not tested in production.

**Table 48. Comparator 1 characteristics**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{\text{DDA}}$	Analog supply voltage	1.65		3.6	V
$T_A$	Temperature range	-40		125	$^{\circ}\text{C}$
$R_{400}$	$R_{400}$ value	300	400	500	$\text{k}\Omega$
$R_{10}$	$R_{10}$ value	7.5	10	12.5	$\text{k}\Omega$
$V_{\text{IN}}$	Comparator input voltage range	0.6		$V_{\text{DDA}}$	V
$V_{\text{REFINT}}$	Internal reference voltage <sup>(1)</sup>	1.202	1.224	1.242	V
$t_{\text{START}}$	Startup time after enable		7	10	$\mu\text{s}$
$t_d$	Propagation delay <sup>(2)</sup>		3	10	$\mu\text{s}$
$V_{\text{offset}}$	Comparator offset error			$\pm 10$	mV
$I_{\text{CMP1}}$	Consumption <sup>(3)</sup>		160	260	nA

1. Tested in production at  $V_{\text{DD}} = 3\text{ V} \pm 10\text{ mV}$ .

2. The delay is characterized for 100 mV input step with 10 mV overdrive on the inverting input, the non-inverting input set to the reference.

3. Comparator consumption only. Internal reference voltage not included.

In the following table, data are guaranteed by design, not tested in production.

**Table 49. Comparator 2 characteristics**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{DDA}$	Analog supply voltage	1.65		3.6	V
$T_A$	Temperature range	-40		125	°C
$V_{IN}$	Comparator input voltage range	0		$V_{DDA}$	V
$t_{START}$	Startup time after enable in fast mode			20	µs
	Startup time after enable in slow mode			30	µs
$t_{df}^{(1)}$	Propagation delay in fast mode			2.5	µs
$t_{ds}^{(1)}$	Propagation delay in slow mode			6	µs
$V_{offset}$	Comparator offset error			±10	mV
$I_{DD(CMP2F)}$	Consumption in fast mode			5	µA
$I_{DD(CMP2S)}$	Consumption in slow mode			2	µA

1. The delay is characterized for 100 mV input step with 10 mV overdrive on the inverting input, the non-inverting input set to the reference.

### 9.3.13 12-bit DAC characteristics

In the following table, data are guaranteed by design, not tested in production.

**Table 50. DAC characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{DDA}$	Analog supply voltage		1.8		3.6	V
$V_{REF+}$	Reference supply voltage		1.8		$V_{DDA}$	
$I_{VREF}$	Current consumption on $V_{REF+}$ supply	$V_{REF+} = 3.3$ V, no load, middle code (0x800)		130	220	$\mu$ A
		$V_{REF+} = 3.3$ V, no load, worst code (0x000)		220	350	
$I_{VDDA}$	Current consumption on $V_{DDA}$ supply	$V_{DDA} = 3.3$ V, no load, middle code (0x800)		210	320	
		$V_{DDA} = 3.3$ V, no load, worst code (0x000)		320	520	
$T_A$	Temperature range		-40		125	$^{\circ}$ C
$R_L^{(1)(2)}$	Resistive load	DACOUT buffer ON	5			k $\Omega$
$R_O$	Output impedance	DACOUT buffer OFF		8	10	k $\Omega$
$C_L^{(3)}$	Capacitive load				50	pF
DAC_OUT <sub>(4)</sub>	DAC_OUT voltage	DACOUT buffer ON	0.2		$V_{REF+} - 0.2$	V
		DACOUT buffer OFF	0		$V_{REF+} - 1$ LSB	V
$t_{\text{settling}}$	Settling time (full scale: for a 12-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches the final value $\pm 1$ LSB)	$R_L \geq 5$ k $\Omega$ , $C_L \leq 50$ pF		7	12	$\mu$ s
Update rate	Max frequency for a correct DAC_OUT (@95%) change when small variation of the input code (from code i to i+1LSB).	$R_L \geq 5$ k $\Omega$ , $C_L \leq 50$ pF			1	Msp/s
$t_{\text{WAKEUP}}$	Wakeup time from OFF state. Input code between lowest and highest possible codes.	$R_L \geq 5$ k $\Omega$ , $C_L \leq 50$ pF		9	15	$\mu$ s
PSRR+	Power supply rejection ratio (to $V_{DDA}$ ) (static DC measurement)	$R_L \geq 5$ k $\Omega$ , $C_L \leq 50$ pF		-60	-35	dB

1. Resistive load between DACOUT and GNDA
2. Output on PF0 or PF1
3. Capacitive load at DACOUT pin
4. It gives the output excursion of the DAC

In the following table, data based on characterization results, not tested in production.

**Table 51. DAC accuracy**

Symbol	Parameter	Conditions	Typ.	Max.	Unit
DNL	Differential non linearity <sup>(1)</sup>	$R_L \geq 5 \text{ k}\Omega$ , $C_L \leq 50 \text{ pF}$ DACOUT buffer ON <sup>(2)</sup>	1.5	3	12-bit LSB
		No load DACOUT buffer OFF	1.5	3	
INL	Integral non linearity <sup>(3)</sup>	$R_L \geq 5 \text{ k}\Omega$ , $C_L \leq 50 \text{ pF}$ DACOUT buffer ON <sup>(2)</sup>	2	4	
		No load DACOUT buffer OFF	2	4	
Offset	Offset error <sup>(4)</sup>	$R_L \geq 5 \text{ k}\Omega$ , $C_L \leq 50 \text{ pF}$ DACOUT buffer ON <sup>(2)</sup>	$\pm 10$	$\pm 25$	
		No load DACOUT buffer OFF	$\pm 5$	$\pm 8$	
Offset1	Offset error at Code 1 <sup>(5)</sup>	DACOUT buffer OFF	$\pm 1.5$	$\pm 5$	
Gain error	Gain error <sup>(6)</sup>	$R_L \geq 5 \text{ k}\Omega$ , $C_L \leq 50 \text{ pF}$ DACOUT buffer ON <sup>(2)</sup>	+0.1/-0.2	+0.2/-0.5	%
		No load DACOUT buffer OFF	+0/-0.2	+0/-0.4	
TUE	Total unadjusted error	$R_L \geq 5 \text{ k}\Omega$ , $C_L \leq 50 \text{ pF}$ DACOUT buffer ON <sup>(2)</sup>	12	30	12-bit LSB
		No load -DACOUT buffer OFF	8	12	

1. Difference between two consecutive codes - 1 LSB.
2. In 48-pin package devices the DAC2 output buffer must be kept off and no load must be applied on the DAC\_OUT2 output.
3. Difference between measured value at Code  $i$  and the value at Code  $i$  on a line drawn between Code 0 and last Code 1023.
4. Difference between the value measured at Code (0x800) and the ideal value =  $V_{REF+}/2$ .
5. Difference between the value measured at Code (0x001) and the ideal value.
6. Difference between the ideal slope of the transfer function and the measured slope computed from Code 0x000 and 0xFFFF when buffer is ON, and from Code giving 0.2 V and ( $V_{DDA} - 0.2$ ) V when buffer is OFF.

In the following table, data are guaranteed by design, not tested in production.

**Table 52. DAC output on PB4-PB5-PB6<sup>(1)</sup>**

Symbol	Parameter	Conditions	Max	Unit
$R_{int}$	Internal resistance between DAC output and PB4-PB5-PB6 output	$2.7 \text{ V} < V_{DD} < 3.6 \text{ V}$	1.4	k $\Omega$
		$2.4 \text{ V} < V_{DD} < 3.6 \text{ V}$	1.6	
		$2.0 \text{ V} < V_{DD} < 3.6 \text{ V}$	3.2	
		$1.8 \text{ V} < V_{DD} < 3.6 \text{ V}$	8.2	

1. 32 or 28-pin packages only. The DAC channel can be routed either on PB4, PB5 or PB6 using the routing interface I/O switch registers.

Table 53. ADC1 characteristics (continued)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_S$	Sampling time	$V_{AIN}$ PF0/1/2/3 fast channels $V_{DDA} < 2.4$ V	0.43 <sup>(3)(4)</sup>			$\mu$ s
		$V_{AIN}$ PF0/1/2/3 fast channels $2.4$ V $\leq V_{DDA} \leq 3.6$ V	0.22 <sup>(3)(4)</sup>			$\mu$ s
		$V_{AIN}$ on slow channels $V_{DDA} < 2.4$ V	0.86 <sup>(3)(4)</sup>			$\mu$ s
		$V_{AIN}$ on slow channels $2.4$ V $\leq V_{DDA} \leq 3.6$ V	0.41 <sup>(3)(4)</sup>			$\mu$ s
$t_{conv}$	12-bit conversion time		12 + $t_S$			1/ $f_{ADC}$
		16 MHz	1 <sup>(3)</sup>			$\mu$ s
$t_{WKUP}$	Wakeup time from OFF state				3	$\mu$ s
$t_{IDLE}^{(5)}$	Time before a new conversion				$\infty$	s
$t_{VREFINT}$	Internal reference voltage startup time				refer to <a href="#">Table 46</a>	ms

- The current consumption through  $V_{REF}$  is composed of two parameters:
  - one constant (max 300  $\mu$ A)
  - one variable (max 400  $\mu$ A), only during sampling time + 2 first conversion pulses.
 So, peak consumption is 300+400 = 700  $\mu$ A and average consumption is 300 + [(4 sampling + 2) / 16] x 400 = 450  $\mu$ A at 1MSPS
- $V_{REF}$  must be tied to ground.
- Minimum sampling and conversion time is reached for maximum  $R_{AIN} = 0.5$  k $\Omega$ .
- Value obtained for continuous conversion on fast channel.
- The time between 2 conversions, or between ADC ON and the first conversion must be lower than  $t_{IDLE}$ .

In the following three tables, data are guaranteed by characterization result, not tested in production.

**Table 54. ADC1 accuracy with  $V_{DDA} = 3.3\text{ V to }2.5\text{ V}$**

Symbol	Parameter	Conditions	Typ.	Max.	Unit
DNL	Differential non linearity	$f_{ADC} = 16\text{ MHz}$	1	1.6	LSB
		$f_{ADC} = 8\text{ MHz}$	1	1.6	
		$f_{ADC} = 4\text{ MHz}$	1	1.5	
INL	Integral non linearity	$f_{ADC} = 16\text{ MHz}$	1.2	2	
		$f_{ADC} = 8\text{ MHz}$	1.2	1.8	
		$f_{ADC} = 4\text{ MHz}$	1.2	1.7	
TUE	Total unadjusted error	$f_{ADC} = 16\text{ MHz}$	2.2	3.0	
		$f_{ADC} = 8\text{ MHz}$	1.8	2.5	
		$f_{ADC} = 4\text{ MHz}$	1.8	2.3	
Offset	Offset error	$f_{ADC} = 16\text{ MHz}$	1.5	2	LSB
		$f_{ADC} = 8\text{ MHz}$	1	1.5	
		$f_{ADC} = 4\text{ MHz}$	0.7	1.2	
Gain	Gain error	$f_{ADC} = 16\text{ MHz}$	1	1.5	
		$f_{ADC} = 8\text{ MHz}$			
		$f_{ADC} = 4\text{ MHz}$			

**Table 55. ADC1 accuracy with  $V_{DDA} = 2.4\text{ V to }3.6\text{ V}$**

Symbol	Parameter	Typ.	Max.	Unit
DNL	Differential non linearity	1	2	LSB
INL	Integral non linearity	1.7	3	LSB
TUE	Total unadjusted error	2	4	LSB
Offset	Offset error	1	2	LSB
Gain	Gain error	1.5	3	LSB

**Table 56. ADC1 accuracy with  $V_{DDA} = V_{REF}^+ = 1.8\text{ V to }2.4\text{ V}$**

Symbol	Parameter	Typ.	Max.	Unit
DNL	Differential non linearity	1	2	LSB
INL	Integral non linearity	2	3	LSB
TUE	Total unadjusted error	3	5	LSB
Offset	Offset error	2	3	LSB
Gain	Gain error	2	3	LSB

Figure 42. ADC1 accuracy characteristics

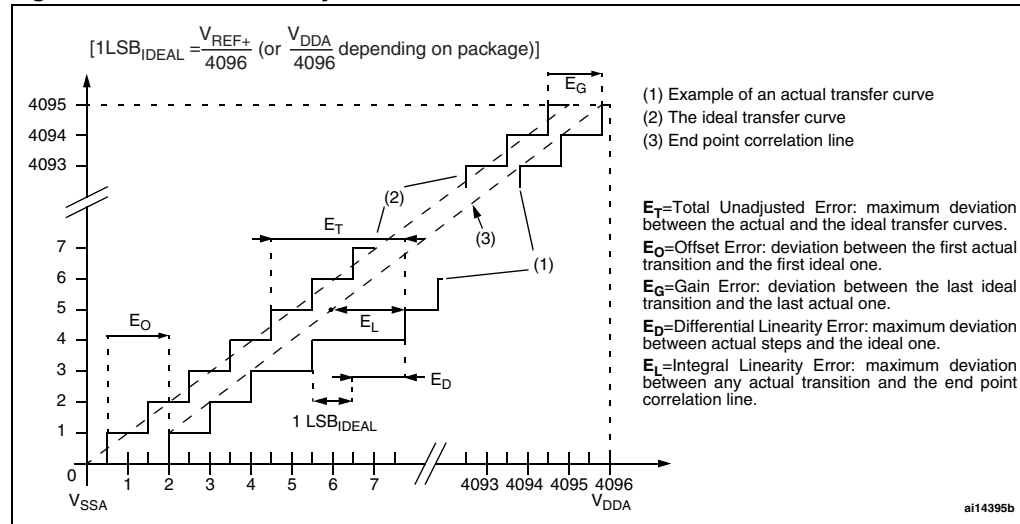

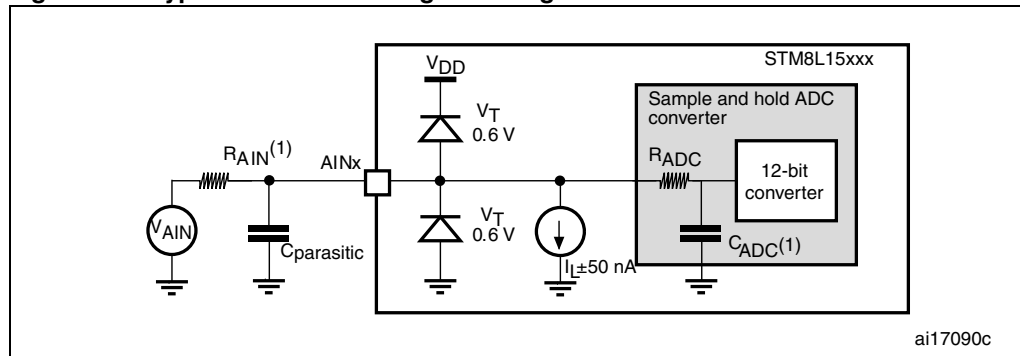

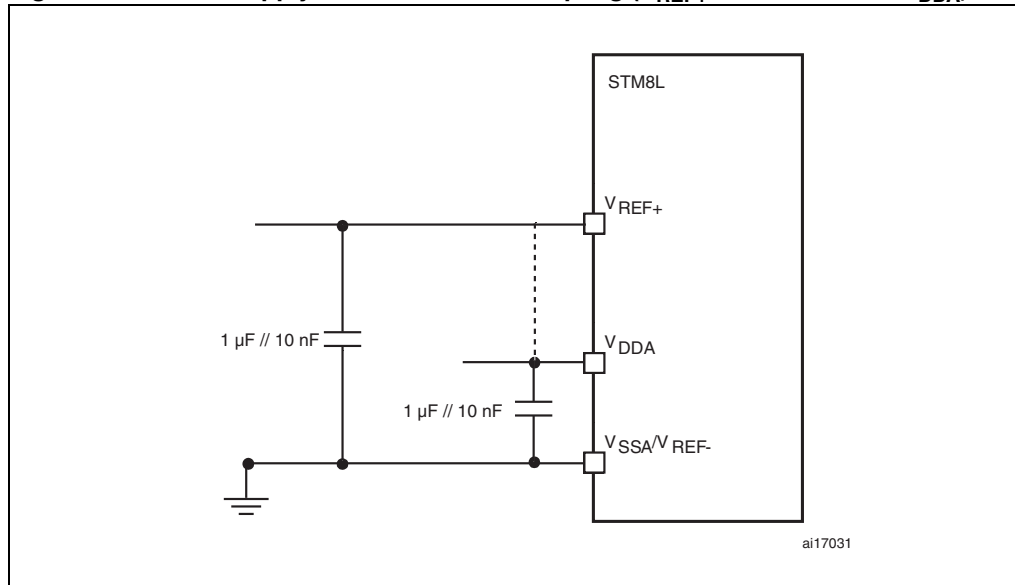

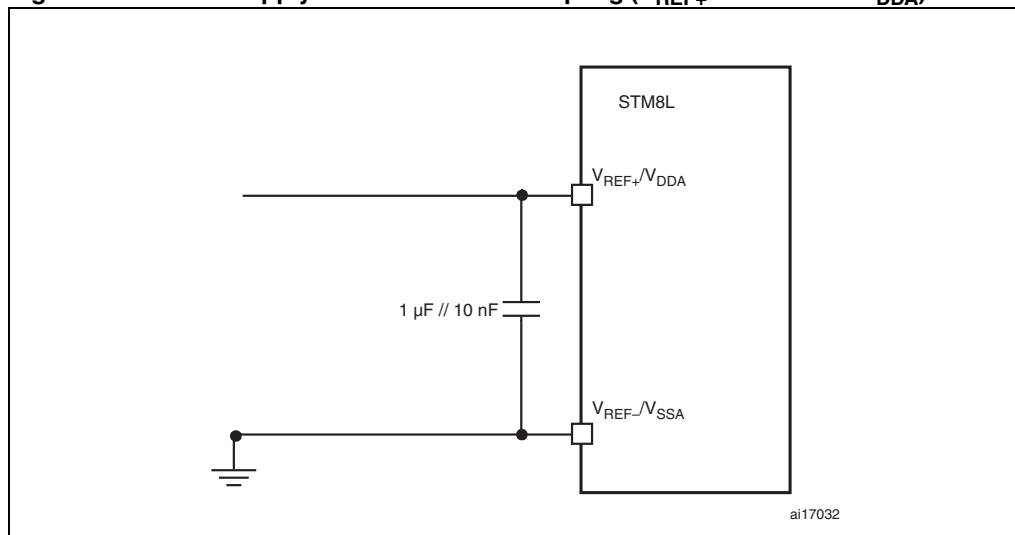

Figure 43. Typical connection diagram using the ADC

1. Refer to [Table 53](#) for the values of  $R_{AIN}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

**General PCB design guidelines**

Power supply decoupling should be performed as shown in [Figure 44](#) or [Figure 45](#), depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. Good quality ceramic 10 nF capacitors should be used. They should be placed as close as possible to the chip.

**Figure 44. Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )****Figure 45. Power supply and reference decoupling ( $V_{REF+}$  connected to  $V_{DDA}$ )**

### 9.3.15 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

#### Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Prequalification trials:

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

**Table 57. EMS data**

Symbol	Parameter	Conditions	Level/Class	
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ }^\circ\text{C}$ , $f_{CPU} = 16\text{ MHz}$ , conforms to IEC 61000	2B	
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ }^\circ\text{C}$ , $f_{CPU} = 16\text{ MHz}$ , conforms to IEC 61000	Using HSI	4A
			Using HSE	2B

#### Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm IEC61967-2 which specifies the board and the loading of each pin.

Table 58. EMI data <sup>(1)</sup>

Symbol	Parameter	Conditions	Monitored frequency band	Max vs.	Unit
				16 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 3.6 V, T <sub>A</sub> = +25 °C, LQFP80 conforming to IEC61967-2	0.1 MHz to 30 MHz	10	dB $\mu$ V
			30 MHz to 130 MHz	4	
			130 MHz to 1 GHz	1	
			SAE EMI Level	1.5	-

1. Not tested in production.

### Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts\*(n+1) supply pin). Two models can be simulated: human body model and charge device model. This test conforms to the JESD22-A114A/A115A standard.

Table 59. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C	2000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)		750	

1. Data based on characterization results, not tested in production.

### Static latch-up

- **LU:** 3 complementary static tests are required on 10 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 60. Electrical sensitivities

Symbol	Parameter	Class
LU	Static latch-up class	II

## 9.4 Thermal characteristics

The maximum chip junction temperature ( $T_{Jmax}$ ) must never exceed the values given in [Table 18: General operating conditions on page 67](#).

The maximum chip-junction temperature,  $T_{Jmax}$ , in degree Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- $T_{Amax}$  is the maximum ambient temperature in °C
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance in °C/W
- $P_{Dmax}$  is the sum of  $P_{INTmax}$  and  $P_{I/Omax}$  ( $P_{Dmax} = P_{INTmax} + P_{I/Omax}$ )
- $P_{INTmax}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$  represents the maximum power dissipation on output pins

Where:

$$P_{I/Omax} = \Sigma (V_{OL} \cdot I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \cdot I_{OH}),$$

taking into account the actual  $V_{OL}/I_{OL}$  and  $V_{OH}/I_{OH}$  of the I/Os at low and high level in the application.

**Table 61. Thermal characteristics<sup>(1)</sup>**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 48- 7 x 7 mm	65	°C/W
$\Theta_{JA}$	Thermal resistance junction-ambient UFQFPN 48- 7 x 7mm	32	°C/W
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 64- 10 x 10 mm	48	°C/W
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 80- 14 x 14 mm	38	°C/W

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

## 10 Package characteristics

### 10.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.
